

movingweather

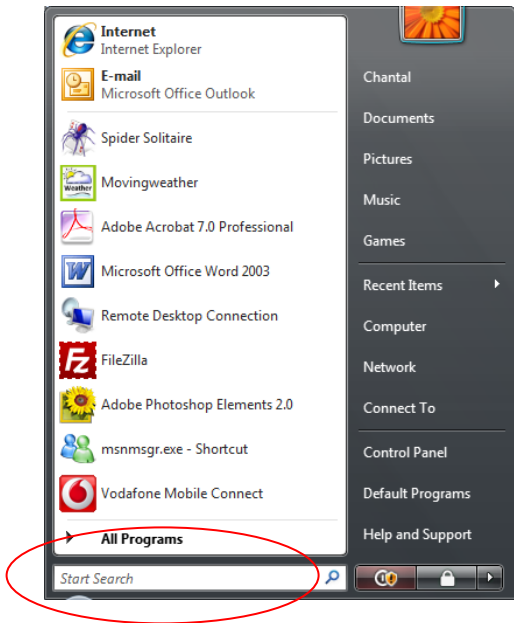

VISTA SET UP GUIDE

SET UP Required for Movingweather Vista for the first time

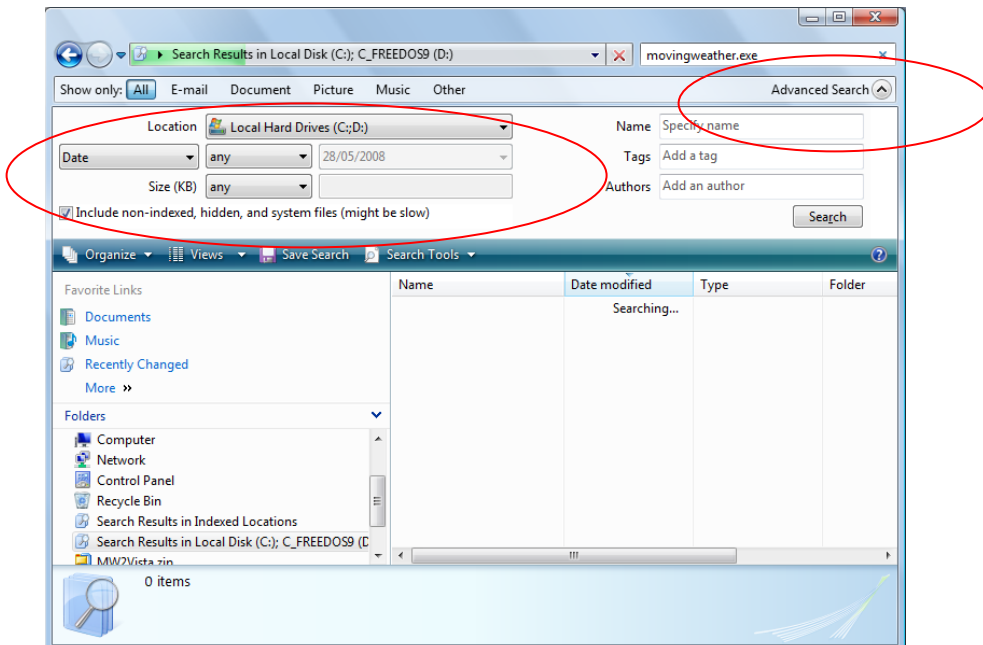

Set Up >>

When MovingWeather has been successfully installed it must be configured to run.

Click the Start Button located in the bottom left corner of the screen and type in movingweather.exe where indicated.

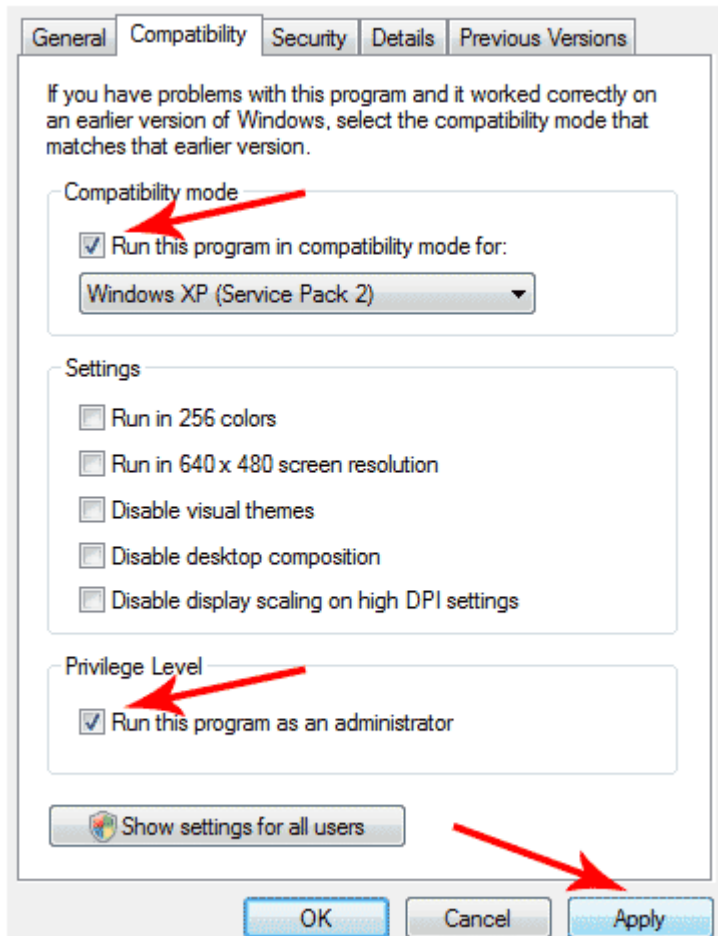

This will bring up the menu below, if you do not see the location, date size options, click on advanced search. It is important that you have Include non-indexed, hidden and system files (might be slow) ticked, with the location being your hard drive.

Then click on Search. This will find all the movingweather files, you need the MovingWeather.exe which is an application file (not a config file). Occasionally you may find that the application file is simply called movingweather, rather than movingweather.exe and that there may be more than one. If there is please do the following to both application files.

Right click the application file named MovingWeather.exe or movingweather and select 'properties' - a new window will open.

Select the tab named 'Compatibility' and tick the box 'run the program in Compatibility mode for:' and select 'Windows XP' from the drop down field also tick the box 'run this program as an administrator' as detailed in the picture below and click the apply button.

Close the find window and double click the MovingWeather icon on your desktop to launch the MovingWeather program..
